

HEAT ILLNESS PREVENTION PLAN

1. Purpose

The purpose of this plan is to protect City employees from the hazards of hot working environments. Work activities that could potentially expose our employees to heat related hazards.

2. Scope

This standard applies whenever an employee performs work activities and the heat index (apparent temperature) equals or exceeds 80 degrees Fahrenheit. It does not apply to incidental exposure that exists when an employee is not required to perform covered work activity for more than 15 minutes in any sixty-minute period, nor does it apply to the transportation of employees inside vehicles when they are not otherwise performing work. When any other applicable standard addresses other hazards that may be present, both standards shall be followed. Where the requirements of one standard are more restrictive than the other, the more stringent requirements shall be followed.

3. Definitions

Acclimatization - temporary adaptation of the body to work in the heat that occurs gradually when a person is exposed to it.

Drinking water - Potable water that is suitable to drink and that is cool (66°F - 77°F) or cold (35°F - 65°F). Drinking water packaged as a consumer product and electrolyte-replenishing beverages that do not contain caffeine (for example, sports drinks) are acceptable substitutes, but should not completely replace the required water.

Feasibility – refers to the ability of an employer to implement any requirement in a rule. Oregon OSHA rules never prohibit work. Whether feasibility is mentioned in a provision of the rule or not, if the employer can demonstrate that it is functionally impossible to comply or if doing so would prevent completion of the work, the employer need not comply, but must take any available reasonable alternative steps to protect the employees involved.

Heat Illnesses - medical conditions resulting from the body's inability to cope with a particular heat load, and includes heat cramps, heat exhaustion, heat syncope and heat stroke.

Heat Index - The heat index, also known as the apparent temperature, is what the temperature feels like to the human body when relative humidity is combined with the air temperature. The heat index is calculated using equations published by the National Oceanic and Atmospheric Administration's National Weather Service. It can be readily determined using the OSHA-NIOSH Heat Safety Tool App that can be downloaded for free on smart phone.

(<https://www.cdc.gov/niosh/topics/heatstress/heatapp.html>) or the online calculator available from the National Weather Service (<https://www.wpc.ncep.noaa.gov/html/heatindex.shtml>).

For the purposes of this rule, the heat index in an indoor space can be calculated by substituting the measured indoor temperature in the calculation and leaving the humidity unchanged OR by substituting both the measured indoor temperature and the measured indoor humidity.

Relative humidity – the amount of water vapor present in air expressed as a percentage of the amount needed for saturation at the same temperature.

Shade – blockage of direct sunlight. One indicator that blockage is sufficient is when objects do not cast a shadow in the area of blocked sunlight. Shade is not adequate when heat in the area of shade defeats the purpose of shade, which is to allow the body to cool. For example, a car sitting in the sun does not provide acceptable shade to a person inside it, unless the car is running with working air conditioning.

4. Policy

It is the policy of the City of Woodburn to follow and adhere to Oregon OSHA rules addressing employee exposure to high ambient temperatures and heat illness prevention. Therefore, the City implements the following heat-related practices to help prevent employees from suffering from heat illness while at their work site(s).

5. General Guidelines

5.1. Access to shade

Supervisors shall establish and maintain one or more shade areas when the heat index temperature in the work area equals or exceeds 80 degrees Fahrenheit for employees whose work activities are covered by this rule. Shade may be provided by any natural or artificial means that does not expose employees to unsafe or unhealthy conditions and that does not deter or discourage access or use. A shade area must meet the following:

1. The shade area must either be open to the air or provide mechanical ventilation for cooling.

2. The amount of shade present must be at least enough to accommodate the number of employees on recovery or rest periods, so that they can sit in a normal posture fully in the shade.
3. The shade must be located as close as practical to the areas where employees are working.
4. Shade present during meal periods must be large enough to accommodate the number of employees on the meal period that remain onsite.

If providing access to shade is not safe or feasible in a particular situation (for example, during high winds or when an employee is walking through range land), then alternative cooling measures that provide equivalent protection shall be identified and implemented.

5.2. Drinking water

Supervisors must ensure that an adequate supply of additional drinking water is readily accessible to employees whose work activities are covered by this rule at all times and at no cost when the heat index in the work area equals or exceeds 80 degrees Fahrenheit.

1. Supervisors shall ensure enough water to enable employees to consume 32 ounces per hour shall be available.
2. Supervisors are not required to supply the entire quantity of drinking water needed to be supplied for all employees on a full shift at the beginning of the shift, but ensure effective procedures are established to replenish the water consumed during the shift.
3. Supervisors must ensure that employees have ample opportunity to drink water supplied under this section. During moderate activity, in moderately hot conditions, employees should be instructed to drink 8 ounces of liquid every 15-20 minutes. Drinking extreme amounts of water can also be harmful (more than 12 quarts in a 24-hour period).
4. Supervisors should encourage employees to frequently drink small amounts of water before they become thirsty to stay hydrated. Employees can monitor their hydration with a urine chart. Urine should be clear or slightly colored; dark urine is a warning sign.
5. Supervisors should remind employees to eat regular meals and snacks as they provide enough salt and electrolytes to replace those lost through sweating as long as enough water is consumed.

5.3. Acclimatization

When air temperatures are expected to rise quickly, Supervisors should gradually increase workloads and allow more frequent breaks during the first week of work so that employees become acclimatized to higher temperatures, especially those who are new to working in the heat or have been away from that work for a week or more.

5.4. High Heat Practices

Supervisors must implement the following additional high heat practices when the ambient heat index exceeds 90 degrees Fahrenheit.

- a. Effective communication by voice, observation, or electronic means is maintained so that employees at the work site can contact a supervisor when necessary. An electronic device, such as a cell phone or text messaging device, may be used for this purpose only if reception in the area is reliable.
- b. Supervisors shall observe employees for alertness and signs and symptoms of heat illness and monitor to determine whether medical attention is necessary by implementing one or more of the following:
 1. Regular communication with employees working alone, such as by radio, cellular phone, or other alternative means, or
 2. Create a mandatory buddy system, or
 3. Implement other equally effective means of observation or communication.
- c. One or more employees on each worksite shall be authorized to call for emergency medical services. Any employee can call for emergency services when designated employees are not immediately available.
- d. Each employee must take a minimum ten-minute preventative cool-down rest period in the shade at least every two hours, regardless of the overall length of the shift.
- e. Note: The preventative cool-down rest period required by this paragraph may be provided concurrently with any other meal or rest period required by policy, rule or law if the timing of the preventative cool-down rest period coincides with the otherwise required meal or rest period. Except when such a rest period coincides with the existing unpaid meal break, the preventative cool-down rest period is a work assignment and must be compensated accordingly.

6. Training

All employees, including new employees, supervisory, and non-supervisory employees will be trained in the following topics, before employees begin work that can reasonably be anticipated to expose employees to a heat index equal to or in excess of 80 degrees Fahrenheit:

1. The environmental and personal risk factors for heat illness, as well as the added burden of heat load on the body caused by exertion, clothing, and personal protective equipment.
2. The procedures for complying with the requirements of this standard, including, but not limited to, the employer's responsibility to provide water, provide daily heat index information, shade, cool-down rests, how to report symptoms of heat-related illness, and access to first aid as well as the employees' right to exercise their rights under this standard without fear of retaliation.

3. The concept, importance, and methods of acclimatization.
4. The importance of employees immediately reporting symptoms or signs of heat illness in themselves, or in co-workers.
5. The effects of non-occupational factors (medications, alcohol, obesity, etc.) on tolerance to occupational heat stress.
6. The different types of heat-related illness, the common signs and symptoms of heat-related illness.

Supervisors may utilize the fact sheets regarding heat illness prevention as provided in the attachment at the end of this policy.

7. Emergency Medical Plan

When the ambient temperature exceeds the heat index of 90 degrees Fahrenheit, if a supervisor observes, or any employee reports, any signs or symptoms of heat illness in any employee, the supervisor must take immediate action appropriate to the severity of the illness:

1. All employees should report immediately any symptoms of heat illness in themselves or if they observe a co-worker to display them.
2. If a supervisor observes signs or an employee reports symptoms of heat illness, the employee must be relieved from duty and provided with a sufficient means to reduce body temperature. Examples include, but are not limited to: cooling blankets, cooling vests, and fans.
3. If the signs or symptoms are indicators of severe heat illness (such as, but not limited to, decreased level of consciousness, staggering, vomiting, disorientation, irrational behavior or convulsions), immediately implement emergency response procedures.
4. An employee exhibiting signs or symptoms of heat illness must be monitored and must not be left alone or sent home without being offered onsite first aid and/or being provided with emergency medical services in accordance with the employer's procedures.

Emergency Response Procedures include the following: Supervisor shall contact emergency medical services immediately and, if necessary and instructed to do so by the medical professionals, transport employees to a place where they can be reached by an emergency medical provider. While waiting for emergency responders to arrive, the supervisor may also cool the employee by moving them to an air-conditioned environment or a cool, shady area.

Supervisor shall ensure that, in the event of an emergency, clear and precise directions to the work site is provided for first responders to quickly navigate to the location of the affected worker.

9. Review of Policy and Procedures

This policy will be reviewed annually or as state and federal regulations are revised and necessitate a change in the policy or procedures.

Adopted: July 2021

Heat exposure can be dangerous

Signs of a medical emergency!

- Abnormal thinking or behavior
- Slurred speech
- Seizures
- Loss of consciousness

Take these actions

- 1** » CALL 911 IMMEDIATELY
- 2** » COOL THE WORKER RIGHT AWAY WITH WATER OR ICE
- 3** » STAY WITH THE WORKER UNTIL HELP ARRIVES

Prevent Heat Illness at Work

Ease into Work. Nearly 3 out of 4 fatalities from heat illness happen during the first week of work.

Build a tolerance to heat by increasing intensity by 20% each day.

Drink cool water even if you are not thirsty

Rest for long enough to recover from the heat

Take breaks in a shady or cool area

Wear a hat and dress for the heat

Watch out for each other

Verbally check on workers wearing face coverings

Heat illness signs and symptoms

Watch for signs of heat illness and act quickly. When in doubt, call 911.

If a worker experiences:

Headache or nausea
Weakness or dizziness
Heavy sweating or hot, dry skin
Elevated body temperature
Thirst
Decreased urine output

Take these actions:

- » Give cool water to drink
- » Remove unnecessary clothing
- » Move to a cooler area
- » Cool with water, ice, or a fan
- » Do not leave alone
- » Seek medical care (if needed)
